

SHIMURA CURVES OF GENUS AT MOST TWO

JOHN VOIGHT

A Shimura curve $X_0^{\mathfrak{D}}(\mathfrak{N})$ is defined by the following data:

- the *base field*, a totally real number field F ;
- the *discriminant*, a squarefree ideal \mathfrak{D} of F such that $[F : \mathbb{Q}]$ and the number of prime factors of \mathfrak{D} have opposite parity; and
- the *level*, an ideal \mathfrak{N} of F coprime to \mathfrak{D} .

Let B be the quaternion algebra over F ramified exactly at the places dividing \mathfrak{D} and all but one real place. Let \mathcal{O} denote an Eichler order in B of level \mathfrak{N} , and let $\Gamma_0^{\mathfrak{D}}(\mathfrak{N})$ denote the image in $PSL_2(\mathbb{R})$ induced by the unique split real place of the units of norm 1 in \mathcal{O} . Then $X_0^{\mathfrak{D}}(\mathfrak{N}) = \Gamma_0^{\mathfrak{D}}(\mathfrak{N}) \backslash \mathfrak{H}^{(*)}$, where $\mathfrak{H}^{(*)}$ denotes upper half-plane (completed if $B \cong M_2(\mathbb{Q})$).

If Γ is a Fuchsian group of genus g having exactly t elliptic cycles of orders m_1, \dots, m_t and s parabolic cycles, then we say Γ has *signature* $\sigma = (g; m_1, \dots, m_t; s)$. We abbreviate $m^k = \underbrace{m, \dots, m}_k$.

In the following tables, for each Shimura curve $X_0^{\mathfrak{D}}(\mathfrak{N})$ of genus $g \leq 2$, we record the discriminant d_F of F , the norms $D = N_{F/\mathbb{Q}}(\mathfrak{D})$, $N = N_{F/\mathbb{Q}}(\mathfrak{N})$, and the signature σ of $\Gamma_0^{\mathfrak{D}}(\mathfrak{N})$. This way of recording curves is compact but ambiguous; nevertheless, in all but a handful of cases, the field F is determined by its discriminant, and for *any* choice of squarefree \mathfrak{D} (including the choice of ramified infinite places) and coprime \mathfrak{N} , the curve $X_0^{\mathfrak{D}}(\mathfrak{N})$ has the given signature. For the handful of exceptions, we refer to the complete tables which are available online:
